DrupalCon SF2010 Core Sprint

Khalid Baheyeldin

<http://2bits.com>

The logo for '2bits' features the number '2' in a bright green color, followed by the word 'bits' in a dark grey, stylized font. The 'i' in 'bits' has a small green square above it. The entire logo is set against a light grey background with a subtle reflection effect below it.

About me

- Khalid Baheyeldin (Not Khaleeed!)
- d.o (kbahey #4063), since 2003
- Core contributions:
 - Site offline feature
 - watchdog hook (pluggable logging, syslog, ...etc.)
 - various smaller patches
- Contributions (37+ modules)
- Full time Drupal consulting (performance, optimization, development, hosting)

Problem:

- Drupal core is in several directories under public_html (includes, modules, themes)
- Other stuff (scripts, cron.php, xmlrpc.php, install.php, update.php)
- Makes upgrades difficult
 - Several directories and files involved
 - Not everyone uses a VCS
- Makes backups difficult
- #22336, bikeshedded to death ... stalled

Proposed Solution

- All core *as downloaded* should be in a top level directory.
- Perhaps “drupal”, “core”, or even “thingie” (I don't care much about the name).
- Except index.php, .htaccess, and robots.txt.
- Other stuff you download (profiles, themes, modules, files,) should go in another top level directory.

Visually ...

- core/
- sites/
 - sites/all/themes/
 - sites/all/modules/contrib/
 - sites/all/modules/custom/
 - sites/default/settings.php
 - sites/default/files/
- index.php
- .htaccess
- robots.txt
